

Concept

The aim of the Volunteer+ website is to create an inclusive and accessible platform that encourages older adults (65+) in Logan City to participate in volunteering and strengthen community connection. The concept is grounded in WCAG 2.2 accessibility principles, ensuring the design supports users with low vision and limited digital confidence.

The mood board informed the use of readable typography, generous spacing and high-ratio colour contrast to enhance legibility, while maintaining a warm, welcoming tone. The colour palette was selected using combinations registered for low-vision readability and the life-ring logo symbolises help, safety and community support.

The low-fidelity wireframes shows an early visualisation of these goals though not all accessibility requirements were incorporated at that stage.

The final website, however, fully implemented these considerations, integrating features such as alt text, skip links and scalable text sizes to enhance inclusivity, confidence, wellbeing and a sense of belonging among older users.

Audience

Volunteer+ is designed for older adults aged 65 and above in Logan City who want to stay active, connected, and purposeful through volunteering. Many in this group experience reduced mobility, vision, or digital confidence, so the site prioritises simplicity, clear navigation, and large touch-friendly targets.

Opportunities are organised into indoor and outdoor categories to suit different comfort levels and physical abilities. Research shows that volunteering supports older adults' psychological wellbeing, life satisfaction, and even physical health making it an effective way to foster confidence, independence, and a lasting sense of belonging within their community.

Volunteer+

No matter how old you are, whether you love to stay active or lend a helping hand from home, Volunteer+ helps you find volunteering opportunities in Logan City.

volunteers do not necessarily have the time; they just have the heart

2.2 Incidence

In a [fact sheet on visual impairment and blindness \[WHO-VI\]](#) the World Health Organization (WHO) estimates that there are 246 million people worldwide who have low vision and 39 million people are blind, indicating that 86% of the people with visual impairments have low vision.

User needs related to visual acuity (clarity) are addressed in the following sections:

- [3.3 Perceiving](#) - text size, font, style, capitalization, size of all elements
- [3.4 Spacing for Reading](#) - leading, letter spacing, word spacing, justification, margins and borders, spacing between elements
- [3.5 Identifying Elements](#) - element-level customization, proportional text increase

Iphone 12pro - Home page

Tablet - Home page

Desktop - Home page

Screenshots of Volunteer+ website

Tablet - Home page

Skip link enables quick keyboard access to main content.

Clear, simple navigation highlights the current page with 18.66 colour contrast ratio.

High-contrast colours improve legibility for low-vision users. (Colour contrast ratio: 11.7 and 18.61).

Large, touch-friendly buttons and simple categories support ease of use for seniors with limited precision in touch control.

Breadcrumb improves orientation particularly for older users who may lose track of location. It meets WCAG 2.4.8 (Location).

Generous spacing and centred alignment improve readability and focus for older users.

The layout meets accessibility goals for older adults by maintaining structured content flow, balanced margins and sufficient white space for clarity.

Tablet - Indoor Category page

Breadcrumb navigation clearly shows users where they are, aiding orientation and meeting WCAG 2.4.8 (Location).

Prominent yellow underlined headings visually emphasise the category, matching navigation cues for consistency.

Tablet - Detailed opportunity page

Each volunteering card follows a uniform template displaying key details such as position and location.

Links use descriptive text rather than sensory cues, supporting WCAG 1.3.3 (Sensory Characteristics) for clarity and inclusivity.

Each section such as Location and Category is clearly separated, helping users visually scan information with ease.

Distinct category headings (Indoor or Outdoor) reinforce context and maintain navigation consistency, helping users easily identify where they are. Short, well-spaced sections further improve readability and reduce cognitive load, supporting users who benefit from clear visual structure.

Design Reflection

One of the main challenges I encountered in my design was presenting multiple volunteer opportunities in a clear and readable way for older adults across all screen sizes. My initial block layout worked well on mobile but became unbalanced on desktop, with cards either stretching too wide or clustering too tightly, making content harder to scan.

I realized the importance of getting the layout right for every screen size before moving to styling. To address this, I learned and applied CSS Grid to the .volunteer-list section. I started with a single column for mobile (grid-template-columns: 1fr) and, at larger viewports (min-width: 1400px), introduced two balanced columns (1fr 1fr), added spacing (gap: 3rem), and centered the layout with max-width: 70rem and margin: 0 auto.

Learning CSS Grid reshaped my design process, emphasizing the need for a responsive structure first to ensure clarity and ease for older users before refining visual details.

GenAI Reflection

I used ChatGPT (by OpenAI) to assist me in developing written content and creating visual assets for my website. It supported my learning by helping me clearly express volunteer opportunities suited for older adults.

ChatGPT was used to help me write and refine volunteer role descriptions in a clear and engaging way that matched my target audience. I also used ChatGPT's image generation feature to create AI-generated photos that represented local volunteering activities in Logan City. For this, I used detailed JSON prompts to produce realistic and context-appropriate images for different pages of my website.

I used GenAI during the content writing and image creation stages only. All HTML and CSS coding was done manually in Visual Studio Code. Using GenAI allowed me to enhance the visual and written quality of my project while maintaining originality and authorship.
